SUMMARY

1	1 Objective	3
2	2 Introduction	4
3	3 Getting Help	5
4	4 The apc processor	6
5	5 The apath mode	7
5.1	5.1 The List command	8
6	6 The aql mode	9
6.1	6.1 The select operation	10
6.2	6.2 The Update operation	12
6.3	6.3 The Delete operation	13

1 OBJECTIVE

This document describes the xpc processor commands

2 INTRODUCTION

The set of available commands for a processor depends on the processor and the current mode.

The samples below use the files into the directory: <repoz_installation_dir>/samples

Note about the sample directory:

To run the Repoz samples of this documentation from a Kikonf installation , replace the directory :
<repoz_intallation_dir>/samples by: <kikonf_intsallation_dir>/samples/repoz.

3 GETTING HELP

The following help commands may be type in any mode.

help shows this help: a long help for the commands available for the mounted processor for the current mode.

h (or help) <command> shows help for this commands available for the mounted processor for the current mode.

h show a short summary of the commands available for the mounted processor for the current mode.

H shows a short summary of the globally available commands (for all mode, all processor).

HELP shows a long help for the globally available commands.

H (or HELP) <command> shows help for this globally available commands.

4 THE APC PROCESSOR

The xpc processor is used to work with properties files (aka attributes) files.
An apc processor is mounted using the apc command like this :

:> xpc -F <repoz_intallation_dir>/samples/test.xml

e.g.:

**:>apc -F <repoz_intallation_dir>samples/test.attrs -D <repoz_intallation_dir>samples/test.attrs.desc
-A -C**

New processor with alias:test, created and mounted.

5 THE APATH MODE

The apath implementation supports one command: ls

To switch to the apath mode :

- Switch to the apath mode
e.g. (from the python : ? mode):
?test:/>: (or type "mode xpath")
:test:/>
- From any mode Create and Mount an xpc processors
e.g.:
:test:/>**apc -F <repoz_intallation_dir>samples/test.attrs -D <repoz_intallation_dir>samples/test.attrs.desc -A -C -a mypc**
New processor with alias:mypc, created. (use mount mypc, to mount it)
:test:/>
- Mount your new processor (if not already mounted)
e.g.:
:test:/>**:mount mypc**
:mypc:/>

5 . 1 THE LIST COMMAND

The ls command list one or more Attributes.

Syntax:

```
ls <attr> [<attr>]
```

e.g.:

```
:>apc -F <repoz_installation_dir>samples/test.attrs -D
```

```
<repoz_installation_dir>samples/test.attrs.desc -A -C
```

New processor with alias:test, created and mounted.

```
:test:/>ls field1 field3
```

```
field1:value1 field3:{ccc:caa,ddd:daa}
```

```
:test:/>
```

The ls command returned values are stored into the Repoz reserved Variable: ro.

```
:test:/>var ro
```

```
{'field3': {'ccc': 'caa', 'ddd': 'daa'}, 'field1': 'value1'}
```

```
:test:/>
```

6 THE AQL MODE

The aql implementation supports 3 commands: **select**, **update**, **delete**

To switch to the aql mode :

- Switch to the apath mode

e.g. (from the python : ? mode):

?test:/>% (or type "mode ql")

%test:/>

- From any mode Create and Mount an apc processors

e.g.:

%test:/>**apc -F <repoz_intallation_dir>samples/test.attrs -D**

<repoz_intallation_dir>samples/test.attrs.desc -A -C -a mypc

New processor with alias:mypc, created. (use mount mypc, to mount it)

%test:/>

- Mount your new processor (if not already mounted)

e.g.:

%test:/:mount mypc

%mypc:/>

6.1 THE SELECT OPERATION

The select operation, selects one or more Attributes according an optional where clause.

Syntax:

select O_WHAT at F_TAGS if F_ATTRS

- Simple select

e.g.:

```
:>apc -F <repoz_installation_dir>samples/test.attrs -D
<repoz_installation_dir>samples/test.attrs.desc -A -C
New processor with alias:test, created and mounted.
:test:/>ls
field1:value1 field2:[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}] field3:
{ccc:caa,ddd:daa}
:test:/>%
%test:/>select field1,field3
      field1      field3
      value1      {ccc:caa,ddd:daa}
```

- Select with a where clause

e.g.:

```
%test:/>select field1,field3 where field1=value1
      field1      field3
      value1      {ccc:caa,ddd:daa}

%test:/>select field1,field3 where field1<>value1
      field1      field3
```

- Select with an imbricated where clause

e.g.:

```
%test:/>select field1,field3 where field1=value1 and ((field1 *in [value2,value1] or field1=value1)
and field1=value1)
      field1      field3
      value1      {ccc:caa,ddd:daa}

%test:/>select field1,field3 where field1=value1 and ((field1 *in [value2,value1] or field1=value1)
and field1<>value1)
      field1      field3
```

Note: There is no limit for parenthesis imbrication.

- Select using complex type and a Repoz Variable

e.g. 1:

```
:>apc -F <repoz_installation_dir>samples/test.attrs -D
```

```
<repoz_installation_dir>samples/test.attrs.desc -A -C
```

New processor with alias:test, created and mounted.

```
:test:/>ls
```

```
field1:value1 field2:[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}] field3:  
{ccc:caa,ddd:daa}
```

```
%test:/>%
```

```
%test:/>select * where field3={ccc:caa,ddd:daa}
```

field1	field2	field3
value1	[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}]	{ccc:caa,ddd:daa}

e.g. 2:

```
%test:/>var v3={ccc:caa,ddd:daa}
```

```
%test:/>var v3
```

```
{'ccc': 'caa', 'ddd': 'daa'}
```

```
%test:/>select * where field3=$v3
```

Var replacement: v3 to: {ccc:caa,ddd:daa}

Var replacement: new line is:select * where field3={ccc:caa,ddd:daa}

field1	field2	field3
value1	[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}]	{ccc:caa,ddd:daa}

6.2 THE UPDATE OPERATION

The Update operation, updates a set of Attributes with a set of pair Attribute/Values.

Syntax:

update set O_SET

Simple update

e.g.:

```
:>apc -F <repoz_installation_dir>samples/test.attrs -D
<repoz_installation_dir>samples/test.attrs.desc -A -C
```

New processor with alias:test, created and mounted.

:test:/>ls

```
field1:value1 field2:[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}] field3:
{ccc:caa,ddd:daa}
```

:test:/>%

%test:/>update set field1=aaa

Updating attr:field1

%test:/>:

:test:/>ls

```
field1:aaa field2:[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}] field3:
{ccc:caa,ddd:daa}
```

:test:/>%

- Update with by complexe type

e.g.:

%test:/>update set field3={ccc:c,ddd:d}

Updating attr:field3

%test:/>:

:test:/>ls

```
field1:aaa field2:[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}] field3:{ccc:c,ddd:d}
```

6 . 3 THE DELETE OPERATION

The Delete operation, deletes one or more Attribute(s)

Syntax:

delete F_ATTRS

e.g.:

:>apc -F <repoz_installation_dir>samples/test.attrs -D

<repoz_installation_dir>samples/test.attrs.desc -A -C

New processor with alias:test, created and mounted.

:test:/>ls

field1:value1 field2:[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}] field3:

{ccc:caa,ddd:daa}

:test:/>%

%test:/>delete field1, field3

%test:/>:

:test:/>ls

field2:[{AAA:ccccA2,BBB:ccccB2},{AAA:bbbbA1,BBB:bbbbB1}]
